

## A B S T R A C T

Disclosed are a method and system for handling document or content off-loading from a document processing system to a large  
5 repository. The content of a document or any attachment attached to the document are detached and physically transferred to a remote repository server and replaced by a placeholder text. The text contains information, e.g., about who archived the document, the time/day of archiving, and the original attachment filename. In  
10 particular, the placeholder text itself is a URL link, for instance a Notes URL link hotspot richtext element. That is, when clicked, a browser is opened, displaying the URL associated with the URL link.

That solution is less resource consuming than the prior art  
15 approaches. It can advantageously be used in mail clients where mail documents, content or attachments are archived to a remote repository server and can be viewed directly without physically transferring them.
